tg @diaamnj

Profile

Fullstack developer with 7 years of experience and a strong backend focus. Experienced in designing and building microservice systems, integrating with external services, and setting up production-ready infrastructure. Currently working with a NestJS, Keycloak, and Kubernetes ecosystem. Building my own multi-tenant SaaS platform from scratch on the side.

Experience

EPAM Systems, Johnson & Johnson

08/2025 – Present | Minsk

Fullstack Developer

Project: B2B platform for ophthalmologists — doctor dashboard and admin support panel. 8+ microservices ecosystem, team of ~6 engineers

- Migrated OAuth from Okta to self-hosted Keycloak for 2 SPAs — the client wanted full control over auth infrastructure
- Split a monolithic NestJS service into two independent BFFs (doctors / admins) with a shared auth library — each profile had its own data and API, keeping everything in one service was no longer viable
- Integrated email/SMS delivery via CRM — centralized microservice with templates and retry for an unstable external API
- Diagnosed CI/CD pipeline failures across services using ArgoCD and Grafana
- Onboarded a new developer — independent task completion within two weeks

Stack: NestJS, TypeScript, React, PostgreSQL, Redis, Keycloak, REST API, OpenAPI, k8s, Yandex Cloud, ArgoCD, Grafana, Docker

Tenly, Multi-Tenant SaaS Platform

01/2026 – Present | Minsk

Fullstack Developer

Project: Tennis tournament management. Team - designer and me as architect

- Designed multi-tenant architecture — each client gets its own PostgreSQL schema, data is isolated at the database level
- Integrated subscription payments via webhooks — implemented signature verification, duplicate call deduplication, and transactional subscription updates with audit log entries
- Set up tenant data caching in Redis, implemented rate limiting on public endpoints, spun up queues for email notifications and background jobs
- Implemented real-time match score updates via SSE and Redis pub/sub

Stack: Node.js, TypeScript, tRPC, Drizzle, PostgreSQL 16, Redis, BullMQ, Docker, Vitest, Playwright

EPAM Systems, International Monetary Fund

07/2024 – 07/2025 | Minsk

Senior Developer

Project: Migration of IMF + 4 domains (200K+ pages, 7 languages) from Sitecore .NET to Next.js/Vercel. Two teams of ~15 engineers

- Built API integration layer with CMS via GraphQL — deduplicated repeated queries to the same data across different page components
- Chose rendering strategy per content type — news updates frequently, reference pages can be pre-generated
- Set up a monorepo with shared packages for 5 sites — without it, teams were drifting apart in their implementations
- Migrated business components from .NET to Next.js in two modes: production for users and preview for CMS editors

Stack: TypeScript, Next.js, GraphQL, Node.js, Vercel, Azure DevOps, Sitecore XM Cloud, Jest, Playwright

EPAM Systems, UI library

02/2023 – 06/2024 | Minsk

Senior Developer

- Enhanced and evolved a monorepo setup by refining architectural design and implementing scalable patterns
- Accelerated a few internal projects using EPAM UI library. Help to deal with state and streaming components from server side
- Developed file-loading functionality and table cell merging feature like Google Docs have by collaborating with Plate.js open source project
- Successfully migrated the WYSIWYG editor from Slate.js to the Plate.js, ensuring seamless integration and improved usability.

EPAM Systems, Elasticsearch Kibana

04/2021 – 01/2023 | Minsk

Senior Developer

Project: Discover plugin — the primary interface for browsing logs and metrics in Kibana

- Participated in plugin migration from AngularJS to React — moved data fetching, unified watchers, and eliminated duplicate queries on filter changes
- Added a virtualized data table — the interface was noticeably slow with 500+ documents before this
- Integrated a notification system for threshold alerts
- Stabilized flaky tests — reduced CI noise that was slowing down the entire team

Stack: TypeScript, React, RxJS, Node.js, Elasticsearch, Jest, Selenium

EPAM Systems, Workforce Management

11/2019 – 03/2021 | Minsk

Developer

Project: Platform specializing in workforce management and human resource solutions

- Drove full-stack feature ownership, transforming complex data from Java backend into scalable Node.js middleware logic and intuitive React user experiences
- Configured development environment using Docker
- Strengthened team communication and conflict resolution skills by collaborating on complex business cases in a multifunctional team.

Stack: TypeScript, React, Node.js, Webpack, Jest, Java, Spring, SQL, Hibernate

Skills

Backend: Node.js, TypeScript, NestJS, Express.js, REST API, GraphQL, WebSocket, Message Brokers, PostgreSQL, MongoDB, Redis, JWT, OAuth2/OIDC, Keycloak

Frontend: React, Next.js, TypeScript, Redux Toolkit

Cloud: Yandex Cloud, AWS

DevOps: Docker, Kubernetes, ArgoCD, Prometheus, Grafana, GitHub Actions

Testing: Jest, Vitest, Supertest, TestContainers, Playwright

English: B2+

Certificates & Education
